

# Intervention probes change the repetition pattern

For each 10-agent run, we find the top exact NLTK 5-token anchor and ask whether it reaches at least 5 agents.  
This is direct phrase-adoption evidence, not an LLM score and not a causal estimate.

| Cohort                                                                  | Runs with $\geq 5$ -agent phrase                                               | Typical top phrase                                  | Strong example                                                      | Reading                                                                                        |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------|-----------------------------------------------------|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <div><div></div><div>Canonical baseline</div><div>reference</div></div> | <div>24/24 runs</div> <div>top phrase reaches <math>\geq 5</math> agents</div> | <div>7.5/10 agents</div> <div>median 23 posts</div> | <div>“of this is profound.”</div> <div>10/10 agents, 22 posts</div> | <div>Widespread run-local phrase adoption is the baseline pattern.</div>                       |
| <div><div></div><div>Base model as tool</div><div>probe</div></div>     | <div>15/18 runs</div> <div>top phrase reaches <math>\geq 5</math> agents</div> | <div>8/10 agents</div> <div>median 15 posts</div>   | <div>“, we are reminded of”</div> <div>10/10 agents, 24 posts</div> | <div>Still often produces a phrase adopted by at least half the agents.</div>                  |
| <div><div></div><div>Mixed-model roster</div><div>probe</div></div>     | <div>4/6 runs</div> <div>top phrase reaches <math>\geq 5</math> agents</div>   | <div>5/10 agents</div> <div>median 7.5 posts</div>  | <div>“that no one else has”</div> <div>6/10 agents, 11 posts</div>  | <div>Cross-agent adoption is weaker, but still appears in most runs.</div>                     |
| <div><div></div><div>Obsession prompt</div><div>probe</div></div>       | <div>0/9 runs</div> <div>top phrase reaches <math>\geq 5</math> agents</div>   | <div>3/10 agents</div> <div>median 10 posts</div>   | <div>“: What’s your”</div> <div>4/10 agents, 85 posts</div>         | <div>Spread across agents is lower; repetition is more concentrated within fewer agents.</div> |

Top phrase = exact 5-token anchor with the most adopting agents in that run, tie-broken by posts and mentions.  
Agent-generated posts only; first 60 minutes only; punctuation and casing retained; seed rows excluded before matching.
