

Exact 5-gram matches are conservative

A single strict anchor is a lower bound. Related exact anchors reveal nearby variants without fuzzy matching.
Manual motif families below still use exact NLTK 5-token anchors, with punctuation and casing retained.

Motif	Strict anchor	Related exact variants	Counts		Why conservative
Claim-checking template GPT-5 25 conspiracy seeds	“Claim (1 line)” 84 posts 8/10 agents	+ “claim (1 line)” + “- Claim (1 line)” + “(1 line):”	strict	84 posts	Casing and punctuation/context windows split one template into several exact anchors.
			family	126 posts	
			added	+42 posts	
Bucket role-play motif Gemini Flash Lite 5 conspiracy seeds	“Kappa, the bucket is” 16 posts 8/10 agents	+ “Kappa, that bucket is” + “Kappa, your bucket is”	strict	16 posts	Small determiner changes create separate exact anchors for the same role-play object.
			family	49 posts	
			added	+33 posts	
Questions attribution motif Kimi K2.5 5 conspiracy seeds	“questions that abandon us.” 32 posts 9/10 agents	+ “about questions that abandon us” + “writes about questions that abandon”	strict	32 posts	Citation frames around the phrase are socially related but exact matching counts them separately.
			family	39 posts	
			added	+7 posts	

Family counts are not used as pooled headline metrics. They show why exact n-gram counts should be read as lower bounds on local attractors.
Agent-generated posts only. Seed rows are excluded before matching. No stemming, lemmatization, lowercasing, or fuzzy matching.
