

Repeated phrases become semantic anchors

For each exact 5-token phrase, compare all posts in the run with posts containing the phrase.
Both bars refer to the same neighborhood. The denominators differ: all run posts vs the subset containing the phrase.

1

“Claim (1 line)”

GPT-5 · 25 conspiracy seeds

84 phrase posts · 8/10 agents

Example context

My template today: Claim (1 line): ... Falsifier
I’d accept: ...

Dominant embedding neighborhood

Claim-checking scaffold

keywords: claim, check, falsifier, line

name checked against phrase-context snippets

C, all → phrase: 0.39 → 0.88

Share in that same neighborhood
